

**Did You Know...**

...that you can set a pre-determined number of condiments during the selection process? This function is useful for Pizza restaurants, for instance, where the product includes a freely selectable number of toppings.

Here's how...

When in a CONDIMENT TABLE OPTION 1-2 is set this condiment table can be used to force a fixed quantity selection of modifiers. This was made for a "Kentucky Fried Chicken" like chain in South-Africa. They wanted to force a fixed selection of modifiers for the kitchen and reports. For example, when an article consists of 5 different modifiers they want to force the operator to select 5 modifiers from the active condiment table before he can continue. When set the last field in the (modifier) list is the required quantity. For example, a condiment table with OPTION 1-1 and OPTION 1-2 set and has the programmed list: 4001, 4002, 4003, 5 will force the operator to select 5 condiments from the list before he can continue.
